

ABSTRACT OF THE DISCLOSURE

A system including a document repository is provided. The system determines, automatically, a level of similarity between at least two of a plurality of discrete elements stored in the document repository. The system then stores data representative of a link between the elements based in-part on the level of similarity. In another embodiment, the system determines a relationship between documents by retrieving a plurality of documents from a document repository. The system segments at least two documents of the plurality of documents into a plurality of conceptually meaningful segments. The system determines if a segment of one document is related to a segment of another document and stores data representative of the relationship.
